I would like to introduce myself. What follows is an open cover letter, that I hope will draw your attention.

7+ years of experience and a demonstrated history of working in both product and service-based organizations in multiple domains like Health Care, Ag Tech, Fantasy/Online Gaming, Affiliate/Digital Marketing, B2B, and News. With a mindset of an Architect to build end-to-end apps, web apps & micro-front ends which are performance, quality, maintainability, modular & atomic. Using tech stacks like React Native, React, TS, JS, and many more...

Presently I am looking for my next role in a diverse and inclusive team, remote may be okay too!

I have good exposure on front end architecture's, HLD's, LLD's & I enjoy working on projects where I can have full-stack autonomy and have a say on systems architecture (strong opinions, held somewhat loosely). I have a data-driven approach to software engineering, and it is not uncommon for me to be seen looking at metrics, and logs to understand what a piece of software is doing.

As for programming languages, I know JavaScript, and Typescript and can write programs in Java, Objective C, Python & C# (although I am still learning those languages). I can also read a number of other programming languages.

In general, I find my role within companies gravitates towards that of a role with adherence to development, a large percentage of my job being communication with other developers and stakeholders.

If any of the above sounds like someone you would be interested in interviewing & hiring, you can drop me a mail at shashankm.malviya@gmail.com or call me at +918269876420.
